WHAT HAPPENS WHEN WE AGE?

**OUR BODY ORGAN AND SYSTEMS WILL
DETERIORATE AND RESULTING IN DEATH !**

ORGANS SHRINK WITH AGE

**30% shrinkage in
size of a human brain**

**30% shrinkage in
size of a human Kidney**

MAIN CAUSES OF AGING

- LIFESTYLE**
- OXIDATION**
- LOSS OF COLLAGEN**
- ACCUMULATION OF TOXINS IN OUR BODY**
- HORMONE DEFFICIENCY**

8 MAIN HUMAN HORMONES

Human Growth Hormone

Vital for human body for the whole life.

Melatonin

Vital for improving quality of sleeps during night time and act as a powerful deoxidizer.

Thyroid Hormones

Vital for normal growth of organs and tissues during childhood as well as maintaining the metabolism of cells, tissues and organs.

Insulin

Vital in enable the cells to absorb glucose generated after consumption, regulating the level of glucose in the blood and prevent diabetes and enable the cell to save energy in form of liver sugar.

DHEA

Vital for enhancing immune system and maintaining the stability of blood pressure.

Estrogen

Vital in maintaining function of brain and ensuring the healthy growth of body tissues, its elasticity and moisturization of vagina, artery and skin.

Progesterone

Another vital hormone for women that stimulate the growth of uterus during pregnancy, promotes the growth of breast tissues and prevent the contraction of uterus cancer.

Testosterone

The most vital sexual hormone for men which is responsible for human's sexual desire, stimulating the growth of hair moustache and beard and improves the function of brain and vision.

HGH is the MASTER HORMONE that has the ultimate ability to activate almost the entire function of the body

WHAT IS HGH & HOW IT WORKS?

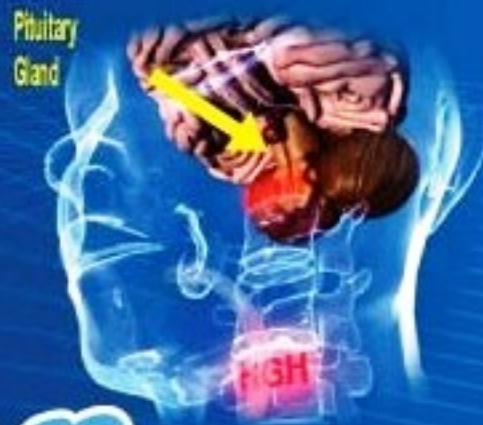

- Human Growth Hormone (HGH) is produced by the pituitary gland located at the lower part of the brain.
- A complex hormones that is made up of 191 amino acids chain.

Release HGH from
pituitary gland

Go through
Liver

Convert HGH
into IGF-1

Regulate
cell growth

THE RESEARCH

“Aging is a disease which is preventable and reversible”

Dr. Daniel Rudman

- Dr. Daniel Rudman is the first scientist that has proven the HGH effect in anti-aging. Clinical studies have shown that HGH can delay the aging process of the body structure and organs for those who are 61 to 81 years old.

(Published in "New England Journal of Medicine Study ; Year 1990 ; July Issue")

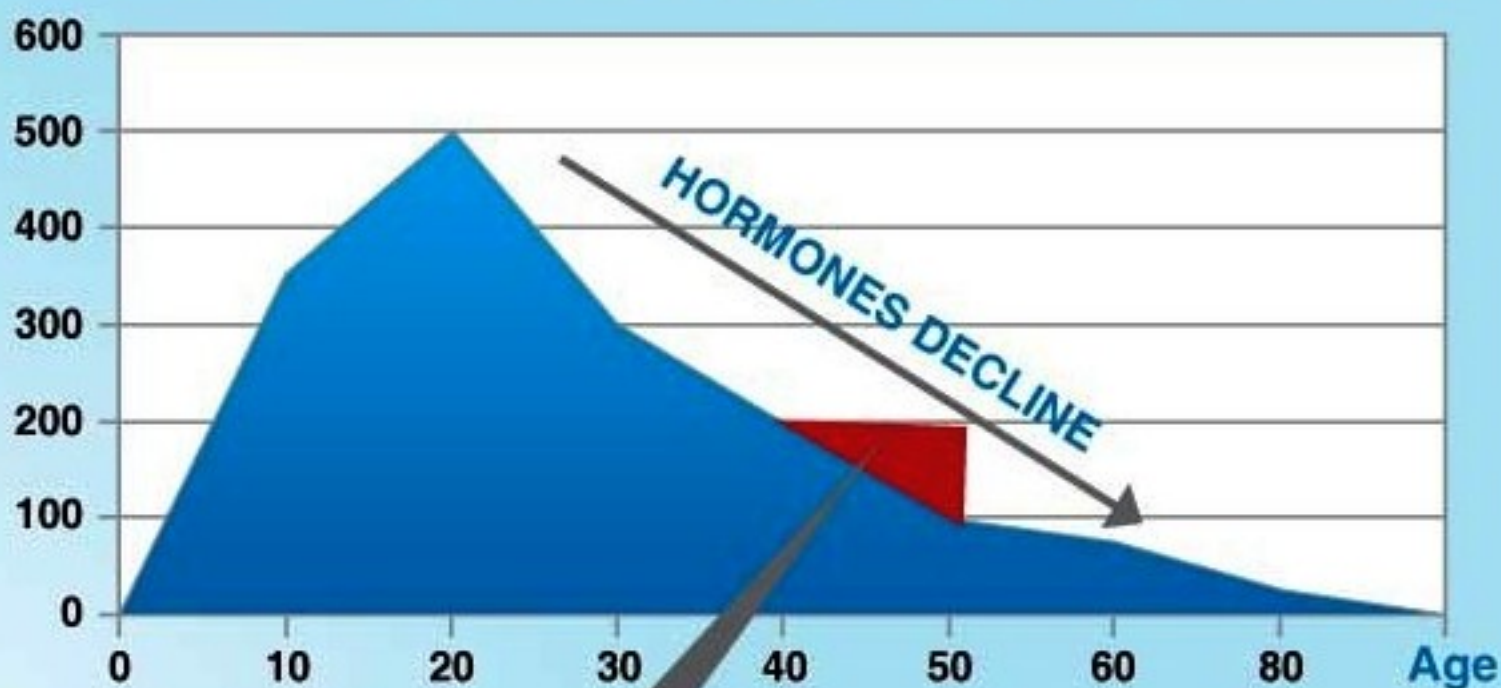

THE RESEARCH

More than 28,000 clinical studies have shown the benefits of HGH

- Anti-aging
- Increases energy level and brain function
- Increases heart and lung function
- Build muscles
- Reduce body fat
- Increases skin density
- Prevent Osteoporosis
- Increases Immune System
- Improves eye sight and memory
- Increases sexual function

WHY DO WE NEED TO RELEASE OUR OWN HGH?

If we can increase your daily HGH secretion from 100µg / l / day to 200µg / l / day, it means we can reverse your biological age 10 years younger.

At 20 years old : 500 µg/l/day
40 years old : 200 µg/l/day
50 years old : 100 µg/l/day

80 years old : 25 µg/l/day

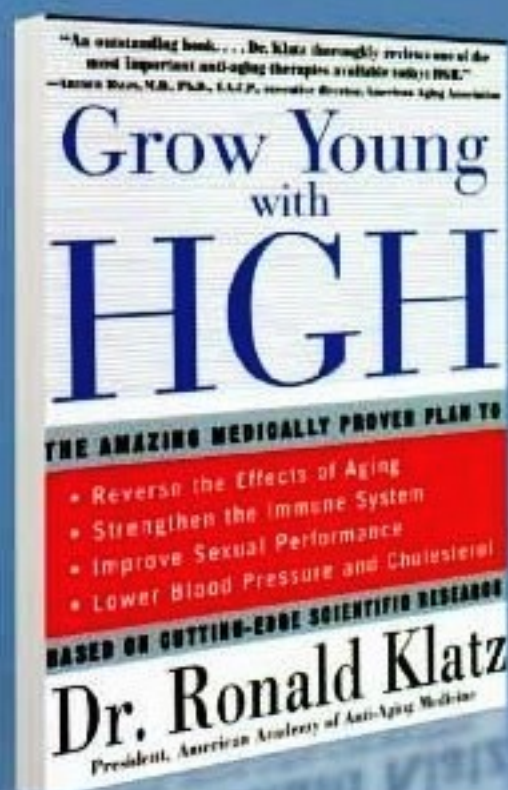

According to Dr. Ronald Klatz

(President, American Academy Of Anti-Aging Medicine) in the book

“Grow Young With HGH”

4 amino acids will stimulate the production of HGH in the pituitary gland:

Arginine

Increases fat burning, improves immune system, prevents cancer cells, builds muscle and increases cells rejuvenation.

Ornithine

Stimulates pancreas to produce insulin. Increases liver function, reduces fat.

Glutamine

Increases cells duplication, builds muscle.

Lysine

Increases immune system, hormones and enzyme.

**BY INCREASING YOUR OWN HUMAN GROWTH HORMONE
YOU CAN SET BACK YOUR BIOLOGICAL CLOCK BY 10-20 YEARS**
